

Week 8 (Joint work)

1. What regular expressions do you use to extract all the dates in this blurb:

<http://bit.ly/regexexercise2> and to put them into the following format YYYY-MM-DD ?

First to extract the dates in the text we write the regular expression:

```
(([0-9][0-9]).([0-9][0-9]).([0-9][0-9][0-9][0-9]))
```

This marks numbers 0-9 first by 2 digits, then by 2 again and then 4 digits because the structure of dates in the text is DD-MM-YYYY

We then open the substitution tab and write: \$3-\$2-\$1 to change the structure of dates to YYYY-MM-DD

Here's a link to the solution: <https://regex101.com/r/5CAytd/1/substitution>

2. Write a regular expression to convert the stopwordslist (list of most frequent Danish words) from Voyant in <http://bit.ly/regexexercise3> into a neat stopwords list for R (which comprises "words" separated by commas, such as <http://bit.ly/regexexercise4>). Then take the stopwordslist from R <http://bit.ly/regexexercise4> and convert it into a Voyant list (words on separate line without interpunction)

Part one: stopwords-list from Voyant into a stopwords-list for R.

First we copy the text from the excel sheet into regex101. We now need to extract the space between the words so we can substitute it with the citation marks and commas. To extract the space we write the expression `((\s+))`. We then substitute the space by writing “, “ in the substitution tab.

Here's a link to the solution: <https://regex101.com/r/RaYP5Y/1/substitution>

Part two: stopwords-list from R into a stopwords-list for Voyant.

First we extract the “, “ between the words with the regex `(" , ")`

Then we substitute what we've extracted with a line shift. We do this with the regex `\n`

Here's a link to the solution: <https://regex101.com/r/0bjBoP/2/substitution>

This regex captures the “, “ between the words and simply replaces it with a new line. The only missing quotation marks are before the first words and after the last words that you can remove manually in Voyant.

3. Does OpenRefine alter the raw data during sorting and filtering?

No, OpenRefine does not alter the raw data during sorting and filtering. You can use the tools in OpenRefine to sort rows and filter words without it having an impact on the raw data.

4. Fix the [interviews dataset](#) in OpenRefine enough to answer this question: "Which two months are reported as the most water-deprived/dryest by the interviewed farmer households?"

* First create a new project based on the dataset

* Then find the row "months_no_water_"

Go to edit cells → Split multi valued cells

Then cluster the months together

'Dec']	11
'July'	2
'May'	1
'Nov']	51
'Oct'	74
['Apr'	1
['Aug'	33
['Jan'	3
['Sept'	70
NULL	45

We can conclude that September and October are the two months reported as the most water deprived

Task 5: Challenge - 10 most common occupations among in [1801 Aarhus](#)

- Total number of people in your selected cohort:
I chose unmarried men between 20-30 and there were 2760 of those in total in the dataset
- Define what is / is not an occupation:

We've tried to make it a bit more streamlined. If people had multiple occupations listed and one of them was soldier, we chose that. And we put things like "skrædersvend", "Skræder", "Skræderkarl"

all under "Skræder". We defined occupation as a paid job. This means that we attempted to avoid registering things like civil status as an occupation. This would often appear in the same column as occupation.

- 10 most frequent occupations (list number of people practising that job with each entry)

The screenshot shows a web interface with a header bar containing a close button, a minus sign, and the text "erhverv". Below the header, it says "258 choices" and "Sort by: name count". The list of occupations is as follows:

Occupation	Count
Soldat	393
Tienestekarl	37
Rytter	35
Væver	33
Matros	16
Skriver	15
Snedker	15
Gaardskarl	14
Skræder	13
Daglejer	11
Løjtnant	11

We clustered for quite a long time. This is what we got as the 10 most common occupations. Everyone who seemed to be in the army as a private were put under "Soldat". We also clustered the rank of "Fendrik", which does not exist anymore as a rank in the modern Danish military, but was somewhere between lieutenant and sergeant, together with "Løjtnant". It is possible to get a slightly different result though, as there seemed to be an almost endless amount of descriptions of military rank and occupation. There seemed to be no standardized ways of writing the different occupations and positions in the military.
